

# Disposal of Hazardous Waste Generated in CA 2005-2009\* (thousands of tons)

\* Based on amounts provided by DTSC

## Disposal of Hazardous Waste Generated in CA 2012, Projected\* (thousands of tons)

\* Based on 2005-2009 amounts provided by DTSC

By 2012 Kettleman Hills Facility (KHF) drastically reduced its annual intake volumes, from 525,000 tons/yr to 12,000 tons/yr, to stay within its overall permitted amounts. Without KHF as an in-state disposal site, up to 75% of hazardous waste generated in California is being sent out-of-state, often to unlined solid waste landfills.
